a basic solution!!! 36 Cr 2 O 72 - + Fe 2+ + H 2 O @ Cr 3+ + Fe 3+ Basic Solution 6 () Fe 2+ Fe 3+ + 1 e- + O + 1 () 14 H + + 7 H 2 O + 14 OHCr 2 O 726 e- + 14 OH 2 14 H Cr 2 O 72 - + 6 Fe 2+ + 7 H 2 O @ 2 Cr 3+ + 6 Fe 3+ + 14 OH- 37 Balancing Redox Equations Practice n. If changes occur, identify the substance being reduced, and the substance being oxidized. Oxidation # Changes an increase in oxidation number of an atom signifies oxidation +2 to +4 a decrease in oxidation number of an atom signifies reduction 0 to -1 17 Identifying Redox Reactions Oxidation and reduction always occur together in a chemical reaction. For this reason, these reactions are called "redox" reactions. n. 3) Balance the "O's" by adding water, H 2 O. Chapter 20 Oxidation-Reduction Reactions (Redox Reactions) 1 The chemical changes that occur when electrons are transferred between reactants are called oxidation - reduction reactions 2 oxidation reactions - principal source of energy on earth - combustion of gasoline - burning of wood - burning food in your body - - 3 Oxidation reactions are always accompanied by a reduction reaction Oxidation - originally meant combining with oxygen - iron rusting (iron + oxygen) Reduction - originally meant the loss of oxygen from a compound removing iron from iron ore (iron II oxide) 4 1. Identify the oxidizing agent and the reducing agent. The hydrogen and hydroxide ions will combine to make water, and you may have to do some canceling before you're done. The [H+] in a basic solution is very small. -3 (x 2 atoms) = 6 electrons gained 0 +4 -2 +3 -2 +2 -2 Fe 2 O 3 + CO Fe + CO 3 2 +2 (X 3 atoms) = 6 electrons lost 4) Finally check to be sure that the equation is balanced both for atoms and charge. Zinc is added to a blue solution of copper(II) sulfate Zn (s) + Cu. SO 4 (aq) Zn. SO 4 (aq) + Cu (s) n. Although there are different ways of identifying a redox reaction, the best is to look for a change in oxidation state: 18 +2 = LEO OA +2 -1 +4 -1 +2 -1 Sn. Cl 2 + Pb. Cl 4 Sn. Cl 4 + Pb. Cl 2 RA -2 = GER -3 = GER RA +2 -2 +1 +5 -2 +2 0 +2 -2 +1 -2 Cu. S + H+ + NO 3 - Cu+2 + S + NO + H 2 O OA +2 = LEO 19 20 Examples - labeling redox reactions n. Electron Transfer in Redox Reactions Today OXIDATION means: - a complete or partial LOSS of ELECTRONS REDUCTION means: - a complete or partial GAIN of ELECTRONS Memory Device : 5 The substance that donates electrons in a redox reaction is the REDUCING AGENT The substance that takes electrons in a redox reaction is the OXIDIZING AGENT 6 Oxidation is... Reduction is... -the loss of electrons -the gain of electrons -an increase in oxidation state -a decrease in oxidation state -the addition of oxygen -the loss of hydrogen -the addition of hydrogen 2 Mg + O 2 @ 2 Mg. O notice the magnesium is losing electrons Mg. O + H 2 @ Mg + H 2 O notice the Mg 2+ in Mg. O is gaining electrons 7 2. 4) Balance the "H's" by adding hydrogen ions, H+. The copper ions are reduced (gain electrons) Zn (s) + Cu 2+ (aq) Zn 2+ (aq) + Cu (s) 40 Copper ions (Cu 2+) collide with the zinc metal surface A zinc atom (Zn) gives up two of its electrons to the copper ion The result is a neutral atom of Cu deposited on the zinc strip, and a Zn 2+ ion released into the solution 41 SIMULATIONS Voltaic Cell Electrolysis Redox Titration 42 Notice that the method has assumed the solution was acidic - we added H+ to balance the equation. For this reason, we will add enough OH- ions to both sides of the equation to neutralize the H+ added in the reaction. Compare Oxidizing Agents Stronger Oxidizing Agent Stronger Reducing Agent 27 Assignment Read page 61 Answer questions 11 -31 28 Balancing Redox Equations There are two methods used to balance redox reactions 1)the oxidation number change method 2)the half reaction method 29 These methods are based on the fact that the total number of electrons gained in reduction must equal the total number of electrons lost in oxidation Redox reactions are often quite complicated and difficult to balance. Assigning Oxidation Numbers (ON) Oxidation States Oxidation states are numbers assigned to atoms that reflect the net charge an atom would have if the electrons in the chemical bonds involving that atom were assigned to the more electronegative atoms. The zinc is oxidized (loses electrons) n. They are assigned according to the following set of rules: 8 #1 The ON of a simple ion is equal to its ionic charge +1 +2 -3 Na + Cu 2+ N 3 - 9 #2 The ON of hydrogen is always +1, except in metal hydrides like Na. H where it is -1 +1 -1 HCl Na. H 10 #3 The ON of oxygen is always - 2 except in peroxides like X 2 O 2 where it is - 1 -2 -1 H 2 O 2 11 #4 The ON of an uncombined element is always zero 0 0 Na Cu N 2 12 #5 For any neutral(zero charge) compound, the sum of the ON's is always zero +4 -2 CO 2 13 #6 For a complex ion, the sum of the ON's equals the charge of the complex ion +7 -2 Mn. O 41 - 14 Examples - assigning oxidation numbers Assign oxidation states to all elements: 15 Assignment Read pages 158 -160 in workbook Answer numbers 1 -10 16 3.
